This volume is formed by 5 review articles.

A very large group of patients with renal artery stenosis has been treated by the group in Göteborg under Bergentz. All problems related to this difficult field are extensively covered and personal results communicated. Dr. Flute from the Department of Haematology, King's College London, gives an outstanding review and sums up the present knowledge in the field of disseminated intra-vascular coagulation Professor Rudowski from Warsaw/Poland reports his extensive experience in the field of blood transfusion, with personal results from the Institute of Haematology and a literature review from this most important field. Professor Thorén from Uppsala presents an up-to-date review of the problems related to magnesium metabolism and surgical practice. Of uppermost practical importance is the article by R. Smith, London, on the treatment of biliary strictures, a field in which the author is an authority and has great personal experience.
